Mikrogen Somatic Cancer Panels

Identifying Somatic Mutations for Tumor Profiling

Each person's cancer, and even parts of a single tumor, can become completely unique. Somatic mutation analysis is a standard of practice for tumors in order to identify therapeutic sensitizing and resistance mutations. This allows a finer assessment of the diagnosis, prognosis and targeted therapies directed towards the patient's tumor profile.

What is Unique Molecular Indexing (UMI) Technology?

UMI Panel integrates unique molecular index (UMI) technology into a gene-specific, primer-based target enrichment process, enabling sensitive variant detection of targeted genomic regions by NGS. UMIs allow us to distinguish between the artifacts generated by PCR from sequence variants present in original molecules. UMIs not only increase the accuracy of detecting mutations, but also increase the accuracy of target quantification. UMIs enable confident detection of low-frequency DNA variants which is crucial for detection of somatic mutations.

Classification of Somatic Variants in Tumors

Data are analyzed by using QIAGEN Clinical Insight (QCI) and Franklin by Genoox variant analysis software. All the detected variants were classified according to the criteria listed below. Tumor-specific actionable (Tier I and Tier II) and clinically associated variants were reported.

Somatic variants can be classified according to their response to personalized medicine practices specific to the primary tumor site or histology. Somatic variants are classified into four tiers based on their level of clinical significance in cancer diagnosis, prognosis, and/or therapeutics according to Malecular Pathology Guidelines (AMP/ASCO/CAP).

Tier I: Variants with Strong Clinical Significance
These variants predict response or resistance to therapies approved by the FDA or included in professional guidelines as diagnostic and/or prognostic biomarkers for specific types of tumors.

Tier II: Variants with Potential Clinical Significance
These are FDA-approved therapies or therapies included in professional guidelines for a different tumor type, or investigative therapies with some clinical evidence.
